THE INFLUENCER'S AGENCY (TIA)

Master Product Requirements Document (PRD)

Product: The Influencer's Agency
Abbreviation: TIA
Product Type: Global Creator Intelligence & Brand–Creator Campaign Marketplace SaaS
Primary Users: Brands and creators
Platforms: Instagram, YouTube, Facebook, X, LinkedIn
Commercial Model: 5% commission on completed campaign transactions
Market Scope: Global
Design Direction: Minimal, geometric, enterprise-grade, white-first
Document Status: Master Product Specification

---

1. PRODUCT VISION

The Influencer's Agency (TIA) is a global technology platform that enables brands to discover, evaluate, verify, contract, communicate with, transact with, and measure creators through a single controlled marketplace.

TIA must not be positioned or implemented as merely an influencer directory.

The product shall combine:

1. Creator discovery
2. Social-account verification
3. Audience intelligence
4. Authenticity and fraud-risk analysis
5. Creator–campaign matching
6. Creator pricing
7. Campaign applications and bidding
8. In-platform communication
9. Digital campaign agreements
10. Payment and transaction management
11. Content submission and approval
12. Campaign analytics
13. Creator and brand reputation
14. AI-assisted recommendations
15. Historical campaign intelligence

The fundamental product loop is:

Discover → Verify → Match → Negotiate → Contract → Transact → Execute → Measure → Learn

The data generated through completed campaigns should progressively improve TIA's recommendation, matching, pricing, and performance intelligence systems.

2. CORE VALUE PROPOSITION

For Brands

TIA enables a brand to answer:

> "Which creator should we work with, why should we work with them, what is their audience actually like, how trustworthy is the account, what should we pay, and how did the campaign perform?"

Instead of relying primarily on follower count, brands receive a structured creator intelligence profile.

Brand receives:

- Creator audience demographics
- Geographic distribution
- Age distribution
- Gender distribution where available
- Interest/category signals where available
- Engagement metrics
- Historical performance
- Audience authenticity indicators
- Account authenticity
- Brand-safety indicators
- Creator reputation
- Campaign history
- Creator pricing
- Campaign compatibility
- Match score
- Estimated campaign outcome
- Post-campaign performance

---

3. FOR CREATORS

TIA enables creators to operate as professional commercial entities.

Creators can:

- Connect social accounts
- Verify account ownership
- Build a professional creator profile
- Receive creator intelligence
- Set campaign rates
- Set availability
- Discover relevant campaigns
- Apply to campaigns

- Bid on campaigns
- Negotiate within TIA
- Communicate with brands
- Receive campaign briefs
- Submit content
- Receive revisions
- Complete campaigns
- Receive payment
- Build reputation
- Review historical performance
- Receive recommendations for suitable campaigns

Creators must not need to move campaign communication outside TIA.

---

4. FUNDAMENTAL MARKETPLACE PRINCIPLE

Closed-loop transaction environment

TIA shall be designed as a controlled marketplace.

The campaign lifecycle must occur within TIA:

Discovery

→ **Application/Bid**

→ **Messaging**

→ **Negotiation**

→ **Agreement**

→ **Payment**

→ **Brief**

→ **Content Submission**

→ **Approval**

→ **Publication**

→ **Performance Tracking**

→ **Completion**

→ **Creator/Brand Reputation**

External communication shall not be a required component of campaign execution.

The system should discourage or technically limit attempts to circumvent TIA's marketplace where commercially and legally appropriate.

---

5. BUSINESS MODEL

Primary revenue

TIA shall charge a **5% platform commission on campaign transactions**.

Example:

Campaign value:

₹100,000

TIA commission:

₹5,000

Creator gross campaign allocation:

₹95,000

The financial architecture must not hard-code the 5% rate into business logic.

The commission must be configurable through an administrative commercial configuration layer so that future pricing models can support:

- Different marketplace rates
- Enterprise agreements
- Promotional rates
- Regional pricing
- Volume-based pricing
- Minimum transaction fees
- Maximum commission caps
- Future subscription products

---

6. PRODUCT PRINCIPLES

The following principles are mandatory.

6.1 Intelligence over vanity metrics

Follower count must never be the sole basis for creator recommendation.

6.2 Trust before transaction

Account authenticity, creator reputation and campaign history must be visible before commercial commitment.

6.3 Data before opinion

Recommendations must expose the principal factors contributing to the recommendation.

6.4 Explainable intelligence

TIA should not simply state:

> "92% Match."

It should explain:

> "92% Match because the creator's audience geography, age distribution, content category and historical campaign performance align with the campaign requirements."

6.5 Marketplace neutrality

TIA should provide objective marketplace intelligence without arbitrarily guaranteeing campaign outcomes.

6.6 Closed-loop execution

Campaigns should be executable without requiring users to move to external communication tools.

6.7 Global architecture

The underlying system must support international users, currencies, languages, time zones and geographic markets.

---

7. SUPPORTED SOCIAL PLATFORMS

TIA shall initially support:

1. Instagram
2. YouTube
3. Facebook
4. X

5. LinkedIn

The platform integration layer must be modular.

Each social platform shall have an independent connector implementing a common internal interface.

Conceptually:

```
Social Integration Layer
│
├── Instagram Connector
├── YouTube Connector
├── Facebook Connector
├── X Connector
└── LinkedIn Connector
```

The application should never tightly couple core creator functionality to one social platform.

---

8. SOCIAL ACCOUNT CONNECTION

A creator must connect at least one supported social account before becoming eligible for marketplace participation.

The onboarding system must:

1. Authenticate the creator.
2. Obtain authorized platform information.
3. Verify ownership where supported.
4. Import permitted account information.
5. Store normalized metrics.
6. Record synchronization status.
7. Display the connected account.
8. Identify stale data.
9. Re-synchronize according to platform/API requirements.

The system must store:

- Platform
- Platform account ID
- Username/handle
- Profile URL
- Profile image
- Account metadata available through permitted APIs
- Followers/subscribers where available
- Engagement metrics where available
- Content metrics where available
- Audience information where available
- Last synchronization timestamp

- Connection status
- Permission status

---

9. SOCIAL DATA ABSTRACTION

Do not design the database around one platform's terminology.

Create normalized concepts:

```
Creator
SocialAccount
Audience
AudienceSegment
ContentItem
PerformanceMetric
FollowerMetric
EngagementMetric
PlatformSnapshot
PlatformConnection
```

Then map platform-specific data into the normalized model.

Example:

YouTube:

Subscribers

Instagram:

Followers

Internal representation:

AudienceSize

This makes future platform additions significantly easier.

---

10. CREATOR ONBOARDING

Step 1 — Account

Creator enters:

- Name
- Email
- Password/authentication method
- Country
- Time zone

Step 2 — Identity

Collect required identity information according to the applicable verification process.

Step 3 — Social accounts

Creator connects one or more supported platforms.

Step 4 — Social analysis

TIA retrieves available information and generates initial intelligence.

Step 5 — Creator profile

Creator completes:

- Category
- Bio
- Languages
- Location
- Content types
- Preferred industries
- Campaign preferences

Step 6 — Pricing

Creator establishes:

- Starting campaign price
- Platform-specific rates
- Deliverable-specific rates
- Optional negotiation preferences

Step 7 — Availability

Creator defines:

- Available dates
- Campaign lead time
- Maximum simultaneous campaigns

Step 8 — Marketplace activation

Creator becomes eligible for campaigns after required verification and onboarding conditions are satisfied.

---

11. CREATOR PROFILE

The creator profile must operate as a professional commercial profile rather than a social-media-style profile.

Header

Display:

- Profile image
- Creator name
- Username
- Verification status
- Primary category
- Location
- Connected platforms
- Creator Intelligence Score

Intelligence section

- Audience quality
- Audience demographics
- Engagement
- Authenticity
- Reputation
- Brand safety
- Campaign history

Commercial section

- Starting rates
- Deliverables
- Availability
- Campaign preferences

Performance section

- Campaigns completed
- Completion rate
- Average rating
- Historical campaign performance

---

12. CREATOR INTELLIGENCE SCORE

TIA shall have a proprietary composite creator score.

Working name:

TIA Creator Intelligence Score™

The score should be composed from multiple independent signals.

Possible dimensions:

- Audience quality
- Audience authenticity
- Engagement quality
- Account authenticity
- Content performance
- Creator reputation
- Campaign completion
- Brand safety
- Historical commercial performance
- Data confidence

Example:

```
CREATOR INTELLIGENCE
94 / 100

Audience Quality       95
Authenticity            94
Engagement              89
Reputation              96
Brand Safety            97
Performance             91
```

The exact weighting must remain configurable.

---

13. DATA CONFIDENCE

Not every social platform exposes identical data.

TIA must therefore distinguish between:

Measured

Estimated

Modelled

Unavailable

The interface must never represent an unavailable metric as though it were directly measured.

Example:

> Audience Location — Measured

versus:

> Audience Interest — Modelled

This distinction is critical for user trust and defensibility.

---

14. AUDIENCE INTELLIGENCE

Where permitted data exists, TIA should analyze:

Geography

- Country
- Region
- City where available

Demographics

- Age
- Gender where available

Interests

- Technology
- Fashion
- Gaming
- Beauty

- Finance
- Fitness
- Food
- Travel
- Education
- Business
- Other categories

Language

- Primary language
- Secondary languages where available

Audience quality

- Authenticity indicators
- Suspicious signals
- Geographic consistency
- Engagement quality

---

15. AUDIENCE AUTHENTICITY ENGINE

TIA must not simply label creators:

> "Fake."

The system should produce risk-oriented signals.

Example:

```
AUDIENCE AUTHENTICITY
94 / 100

Normal growth pattern
Normal engagement distribution
Low suspicious-account signals
No material anomaly detected
```

Potential detection signals include:

- Unusual follower growth
- Abnormal engagement ratios
- Suspicious audience patterns
- Repetitive engagement
- Geographic anomalies
- Sudden unexplained audience changes
- Inconsistent engagement behavior

The fraud engine must maintain evidence/signals supporting its assessment.

---

16. FRAUD / RISK DATABASE

TIA shall maintain its own internal creator-risk intelligence system backed by TIA-generated data.

The system may record:

- Detected anomalies
- Campaign disputes
- Failed campaign completion
- Repeated cancellations
- Suspicious behavior
- Marketplace violations
- Account integrity events
- Evidence references
- Confidence levels
- Investigation status
- Resolution status

The system must distinguish:

Detected signal

from:

Confirmed violation

from:

Resolved issue

A creator must not automatically be classified as fraudulent merely because an algorithm identifies an anomaly.

---

17. CREATOR REPUTATION

Separate intelligence from reputation.

Intelligence

"What does the data say about this creator?"

Reputation

"What has happened when brands have worked with this creator?"

Creator reputation should consider:

- Campaign completion
- Delivery timeliness
- Brand ratings
- Dispute rate
- Cancellation rate
- Revision behavior
- Communication responsiveness
- Contract compliance

Example:

Creator Reputation: 91/100

---

18. BRAND–CREATOR MATCHING ENGINE

The matching engine is a core product subsystem.

A brand campaign contains:

- Campaign objective
- Industry
- Product
- Target geography
- Target age
- Target gender
- Target interests
- Platform
- Creator category
- Budget
- Deliverables
- Timeline
- Performance objective

TIA compares these requirements against creator intelligence.

---

19. TIA MATCH SCORE™

Each creator receives a campaign-specific compatibility score.

Example:

```
96% MATCH

Audience Fit          97
```

```
Geography Fit          98
Category Fit           95
Platform Fit           96
Engagement Quality     92
Price Efficiency       89
Reputation             97
Brand Safety           98
```

The exact score must vary according to campaign objective.

An awareness campaign should not use exactly the same weighting as a conversion campaign.

---

20. MATCH EXPLANATION

Every recommendation must contain an explanation.

Example:

> **96% Match**
>
> 78% of the creator's measured audience is within the campaign's target geography, while the creator's primary content category and historical performance align with the campaign objective.

The explanation must identify meaningful factors rather than generate generic AI text.

---

21. CAMPAIGN SUCCESS PREDICTION

TIA may provide modelled campaign forecasts.

Example:

```
ESTIMATED CAMPAIGN OUTCOME

Success Probability
82%

Expected Reach
1.2M–1.5M

Expected Engagement
65K–82K
```

```
Expected Clicks
18K–24K
```

The system must explicitly classify these outputs as predictions/estimates.

TIA must not represent modelled performance as guaranteed results.

---

22. CAMPAIGN PORTFOLIO OPTIMIZATION

Brands should eventually be able to specify:

> "I have a ₹10 lakh budget. Build the optimal creator mix."

TIA should recommend a portfolio based on:

- Budget
- Audience coverage
- Creator overlap
- Campaign objective
- Geography
- Platform
- Historical performance
- Risk diversification

Example:

```
RECOMMENDED PORTFOLIO

2 Macro Creators
10 Mid-tier Creators
20 Micro Creators
10 Nano Creators
```

The algorithm must explain the principal reasons for the allocation.

---

23. BRAND ONBOARDING

Brand registration must collect:

- Legal/business name
- Contact information
- Country
- Website
- Business category
- Business verification information

- Payment information
- Authorized users

Brand verification status must be visible internally and, where appropriate, to creators.

---

24. BRAND PROFILE

Brands should have:

- Company name
- Logo
- Industry
- Description
- Website
- Location
- Verification
- Campaign history
- Creator ratings
- Completed campaigns
- Reputation
- Payment reliability where appropriate

---

25. BRAND REPUTATION

Creators need protection from problematic brands.

Brand reputation may consider:

- Campaign completion
- Creator ratings
- Payment reliability
- Cancellation rate
- Dispute rate
- Contract compliance
- Communication behavior

Example:

> **Brand Reputation: 93/100**

This must not expose private or legally sensitive information improperly.

---

26. CAMPAIGN CREATION

Campaign creation must use a structured multi-step workflow.

Step 1 — Objective

Options may include:

- Awareness
- Engagement
- Traffic
- Lead generation
- Sales
- Product launch
- App promotion
- Content generation

Step 2 — Target audience

- Geography
- Age
- Gender where relevant
- Interests
- Language

Step 3 — Creator requirements

- Platforms
- Categories
- Audience size
- Audience characteristics
- Intelligence score
- Availability

Step 4 — Deliverables

Examples:

- Reel
- Short video
- Post
- Story
- Long-form video
- YouTube integration
- LinkedIn post
- X post

Step 5 — Budget

Step 6 — Timeline

Step 7 — Campaign brief

Step 8 — Review

Step 9 — Publish

---

27. CAMPAIGN DISCOVERY

Creators should have a marketplace showing campaigns relevant to their profile.

Each campaign listing should display:

- Brand
- Verification
- Campaign name
- Category
- Platforms
- Deliverables
- Budget
- Deadline
- Application deadline
- Match percentage
- Requirements
- Campaign status

---

28. CREATOR APPLICATION

Creators can:

- Apply
- Bid
- Submit proposed price
- Submit proposal
- Provide campaign concept
- Provide expected delivery timeline
- Attach relevant portfolio material

The creator should be able to see:

- Campaign requirements
- Budget structure

- Deliverables
- Deadline
- Eligibility
- Application status

---

29. CAMPAIGN BIDDING

Campaigns can operate under:

Fixed Price

Brand establishes a fixed offer.

Open Bid

Creators submit bids.

Negotiable

Brand and creator negotiate inside TIA.

The commercial negotiation must remain connected to the campaign record.

---

30. IN-PLATFORM COMMUNICATION

TIA messaging is mandatory for campaign communication.

Messaging should support:

- Text
- File attachments
- Images
- Campaign documents
- Content submissions
- System messages
- Contract events
- Payment events
- Revision requests

The conversation should remain linked to the campaign.

---

31. ANTI-CIRCUMVENTION

Because TIA earns a transaction commission, the platform should include commercially reasonable anti-circumvention mechanisms.

Potential mechanisms:

- Detect prohibited external contact details where legally appropriate
- Campaign-linked messaging
- Internal payment
- Internal agreements
- Internal file sharing
- Marketplace policies
- User reporting
- Automated risk flags

Do not rely exclusively on automated detection.

Provide transparent marketplace terms and an appeal mechanism.

---

32. CAMPAIGN NEGOTIATION

Negotiation should operate within the campaign.

Example:

```
Brand Offer
₹50,000

Creator Counteroffer
₹60,000

Brand Counteroffer
₹55,000

Creator Accepted
₹55,000
```

The system should maintain an immutable commercial history.

---

33. DIGITAL AGREEMENT

Once commercial terms are accepted, TIA generates a campaign agreement containing configurable clauses such as:

- Parties
- Deliverables
- Payment
- Deadlines
- Revision limits
- Content requirements
- Usage rights
- Licensing
- Exclusivity
- Cancellation
- Dispute procedures
- Disclosure obligations
- Approval process

The final agreement should be versioned.

---

34. PAYMENT ARCHITECTURE

The payment subsystem must support:

```
Brand
 ↓
TIA Payment System
 ↓
Campaign Funds
 ↓
Completion / Approval
 ↓
Creator Payout
```

The architecture should support:

- Payment authorization
- Payment capture
- Commission calculation
- Refunds
- Partial payments
- Milestones
- Creator payout
- Transaction ledger
- Invoices
- Payment status

- Disputes

Actual payment/escrow implementation must be selected according to the supported jurisdictions and applicable financial regulations.

---

35. FINANCIAL LEDGER

Every transaction must produce an immutable financial record.

Example:

```
Campaign
₹100,000

Platform Commission
₹5,000

Creator Allocation
₹95,000

Payment Processing
X

Tax / Applicable Charges
Y

Creator Net Payout
Z
```

The exact financial calculation must be determined by the payment provider, jurisdiction and applicable tax treatment.

---

36. CAMPAIGN WORKSPACE

Every accepted campaign creates a workspace containing:

- Campaign overview
- Brand
- Creator
- Contract
- Payment
- Deliverables
- Brief
- Messages
- Content
- Revisions

- Timeline
- Analytics
- Activity log

This is the central operating environment for the campaign.

---

37. CONTENT SUBMISSION

Creators should submit campaign deliverables through TIA.

Each submission should have:

- Version
- Timestamp
- File
- Caption
- Platform
- Status
- Notes

Status:

```
Draft
↓
Submitted
↓
Revision Requested
↓
Resubmitted
↓
Approved
↓
Published
```

---

38. CONTENT APPROVAL

Brands can:

Approve

or

Request Revision

Revision requests should support comments and structured requirements.

The system should retain previous versions.

---

39. CAMPAIGN PUBLICATION

Once content is approved, the creator publishes according to the campaign requirements.

Where supported, TIA should collect campaign-performance data through platform integrations.

---

40. CAMPAIGN ANALYTICS

After publication, the campaign dashboard should provide:

- Reach
- Impressions
- Views
- Likes
- Comments
- Shares
- Saves
- Engagement rate
- Clicks where measurable
- Conversions where integrated
- Revenue where measurable
- Cost per engagement
- Cost per click
- Cost per conversion
- ROAS where measurable

Metrics must be labelled according to whether they are directly reported by the platform, calculated by TIA, or modelled.

---

41. PERFORMANCE ATTRIBUTION

TIA should support:

- Tracking links
- Discount codes
- Campaign-specific landing pages
- QR codes
- Affiliate identifiers

This allows TIA to connect:

Creator → Click → Lead → Conversion → Revenue

where the necessary integrations and permissions exist.

---

42. CREATOR PERFORMANCE HISTORY

Completed campaigns should contribute to the creator's internal intelligence profile.

Record:

- Campaign category
- Brand category
- Deliverables
- Campaign value
- Reach
- Engagement
- Clicks
- Conversions
- Completion
- Brand rating
- Campaign outcome

Sensitive commercial information should not automatically become public.

---

43. CREATOR PRICING INTELLIGENCE

Creators may establish their rates.

TIA can additionally calculate a market reference.

Example:

```
YOUR RATE
₹40,000

MARKET RANGE
₹27,000–₹34,000

TIA REFERENCE
₹31,000
```

The system should treat this as pricing intelligence rather than mandatory pricing.

---

44. AVAILABILITY

Creators should maintain:

- Available dates
- Booked dates
- Tentative dates
- Campaign lead time
- Capacity

Brands should be able to filter creators based on availability.

---

45. CREATOR CAMPAIGN RECOMMENDATIONS

The creator dashboard should provide:

Recommended Campaigns

Rank campaigns according to:

- Audience fit
- Category fit
- Platform fit
- Price
- Location
- Campaign requirements
- Creator history
- Availability

Example:

> **94% Match — Apply**

The system should explain why the campaign was recommended.

---

46. CREATOR ANALYTICS DASHBOARD

Creators should see:

- Audience
- Growth
- Engagement
- Platform performance
- Campaign performance
- Earnings
- Average campaign value

- Completion rate
- Ratings
- Intelligence score
- Reputation

---

47. BRAND ANALYTICS DASHBOARD

Brands should see:

- Active campaigns
- Campaign spending
- Creator performance
- Audience reach
- Engagement
- Conversions
- ROAS where measurable
- Campaign success
- Creator ROI
- Historical campaign comparisons

---

48. CREATOR DISCOVERY

Brand search must support:

Basic filters

- Platform
- Category
- Country
- Language
- Audience size
- Price

Intelligence filters

- Match score
- Authenticity
- Engagement
- Reputation
- Brand safety
- Audience geography
- Audience age

Commercial filters

- Availability
- Rate

- Campaign experience

---

49. CREATOR COMPARISON

Brands should be able to select multiple creators and compare them.

Example:

Metric	Creator A	Creator B	Creator C
Intelligence	94	91	89
Audience Match	96%	91%	88%
Authenticity	95	92	94
Engagement	8.1%	6.9%	9.2%
Reputation	97	90	94
Rate	₹25K	₹19K	₹22K

The comparison should focus on decision-relevant metrics rather than visual clutter.

---

50. NOTIFICATION SYSTEM

Notifications should support:

- Campaign invitation
- Application received
- Bid received
- Bid accepted
- Bid rejected
- New message
- Contract ready
- Contract signed
- Payment received
- Payment required
- Content submitted
- Revision requested
- Content approved
- Campaign deadline
- Campaign completion
- Payout status

Channels:

- In-app
- Email

- Push notifications where implemented

---

51. ADMIN PLATFORM

TIA requires a comprehensive administrative system.

Admin modules:

```
Overview
Creators
Brands
Social Accounts
Campaigns
Transactions
Payments
Verification
Risk & Fraud
Disputes
Content Moderation
Reports
Analytics
Platform Configuration
Audit Logs
Support
```

---

52. ADMIN CREATOR MANAGEMENT

Admins must be able to:

- Search creators
- View creator profiles
- Review verification
- Review social connections
- View risk signals
- Suspend accounts
- Restrict marketplace access
- Review reports
- Review disputes
- Review campaign history

Administrative actions must be audited.

---

53. MODERATION

Content and communication may require moderation systems.

The platform should support:

- User reporting
- Content reporting
- Message reporting
- Campaign reporting
- Brand reporting
- Creator reporting
- Automated risk detection
- Human review
- Appeal
- Resolution

---

54. DISPUTE MANAGEMENT

Disputes may involve:

- Payment
- Deliverables
- Quality
- Deadlines
- Contract terms
- Cancellation
- Misrepresentation

Workflow:

```
Dispute Opened
↓
Evidence Submitted
↓
Parties Notified
↓
Review
↓
Decision
↓
Financial Resolution
↓
Case Closed
```

All decisions should be recorded.

---

55. RBAC

The system must use role-based access control.

Creator

Access:

- Own profile
- Own social accounts
- Own campaigns
- Own messages
- Own analytics
- Own payments

Brand User

Access according to company permissions.

Brand Admin

Access:

- Brand users
- Campaigns
- Payments
- Analytics
- Creator interactions

TIA Support

Limited operational access.

TIA Moderator

Moderation/risk access.

TIA Finance

Financial access.

TIA Super Admin

Full administrative access.

---

56. BRAND TEAM STRUCTURE

Even if the initial product is designed around brands rather than agencies, the backend should support:

```
Organization
│
├── Owner
├── Admin
├── Campaign Manager
├── Finance
└── Viewer
```

This enables enterprise expansion without redesigning the authorization system.

---

57. GLOBALIZATION

The architecture must support:

- Multiple currencies
- Multiple countries
- Multiple time zones
- Multiple languages
- Local date formats
- Local number formats
- Country-specific payment methods
- Regional compliance requirements

Currency conversion must use a controlled exchange-rate source where required.

Historical transactions must preserve the original transaction currency and amount.

---

58. SEARCH ENGINE

TIA requires a dedicated search layer rather than querying the transactional database for every creator discovery request.

Search should support:

- Creator name
- Username
- Category
- Platform
- Country
- Audience

- Intelligence score
- Match score
- Price
- Availability
- Reputation

The architecture should permit future semantic search.

Example:

> "Find affordable Indian tech creators with strong LinkedIn audiences."

---

59. RECOMMENDATION ENGINE

The recommendation system should operate in stages:

```
Campaign Requirements
        ↓
Eligibility Filtering
        ↓
Candidate Generation
        ↓
Intelligence Ranking
        ↓
Match Scoring
        ↓
Risk Filtering
        ↓
Commercial Optimization
        ↓
Final Recommendations
```

This is preferable to asking a generic AI model to choose creators without deterministic data controls.

---

60. AI LAYER

AI may assist with:

- Campaign brief generation
- Creator recommendations
- Campaign matching
- Proposal assistance
- Campaign summaries
- Analytics interpretation
- Creator pricing recommendations

- Campaign portfolio construction
- Search interpretation
- Message assistance
- Performance explanations

AI must not become the authoritative source for raw social metrics.

Raw platform data and deterministic calculations remain the source of truth.

---

61. DATA ARCHITECTURE

Core entities should include:

```
User
Organization
Creator
Brand
SocialAccount
Platform
PlatformConnection
Audience
AudienceSegment
ContentItem
ContentMetric
AudienceMetric
CreatorScore
CreatorRiskSignal
CreatorReputation
Campaign
CampaignRequirement
CampaignApplication
CampaignBid
CampaignNegotiation
CampaignContract
CampaignDeliverable
ContentSubmission
Revision
MessageThread
Message
Payment
Transaction
Commission
Payout
Invoice
CampaignMetric
CampaignAttribution
Review
Dispute
```

```
Notification
AuditLog
```

---

62. CREATOR ENTITY

A creator should have:

```
creator_id
user_id
display_name
username
bio
country
region
city
timezone
languages
categories
verification_status
intelligence_score
reputation_score
brand_safety_score
availability_status
created_at
updated_at
```

Social data should remain in separate entities.

---

63. CAMPAIGN ENTITY

A campaign should contain:

```
campaign_id
brand_id
title
description
objective
category
status
budget
currency
application_deadline
campaign_start
campaign_end
```

```
target_geographies
target_demographics
target_interests
required_platforms
deliverables
visibility
created_at
updated_at
```

---

64. CAMPAIGN STATUS MODEL

```
Draft
↓
Published
↓
Accepting Applications
↓
Shortlisting
↓
Negotiation
↓
Contracted
↓
Funded
↓
In Progress
↓
Content Review
↓
Approved
↓
Published
↓
Measuring
↓
Completed
```

Additional terminal states:

- Cancelled
- Disputed
- Suspended
- Failed

---

65. AUDITABILITY

Important marketplace events must create audit records.

Examples:

- Login
- Social connection
- Verification decision
- Campaign creation
- Campaign edit
- Bid
- Negotiation
- Contract acceptance
- Payment
- Content approval
- Dispute decision
- Account suspension

Audit logs should be append-only from the application perspective.

---

66. SECURITY

The system must implement:

- Secure authentication
- MFA capability
- OAuth token protection
- Encryption in transit
- Encryption at rest
- Secrets management
- RBAC
- Session management
- Rate limiting
- API security
- Input validation
- File scanning
- Audit logs
- Backup and disaster recovery
- Monitoring
- Incident response procedures

Social OAuth credentials/tokens must never be exposed to normal users.

---

67. PRIVACY

TIA will process creator, brand, social-account and potentially audience-related information.

The architecture must therefore support:

- Consent management
- Privacy controls
- Data minimization
- Data retention policies
- Data deletion workflows
- Data export
- Access controls
- Regional privacy requirements
- Platform-specific data restrictions

The exact compliance framework should be determined based on TIA's operating jurisdictions and user base.

---

68. API ARCHITECTURE

The application should expose internal service boundaries.

Suggested architecture:

```
Web / Mobile Clients
        ↓
API Gateway
        ↓
Authentication
        ↓
Core Application Services
        ├── Creator Service
        ├── Brand Service
        ├── Campaign Service
        ├── Marketplace Service
        ├── Messaging Service
        ├── Payment Service
        ├── Analytics Service
        ├── Intelligence Service
        ├── Risk Service
        └── Notification Service
```

Social connectors and external providers should remain behind integration interfaces.

---

69. EVENT-DRIVEN OPERATIONS

Major operations should generate events.

Examples:

```
CreatorConnected
CampaignPublished
ApplicationSubmitted
BidCreated
BidAccepted
ContractSigned
PaymentCaptured
ContentSubmitted
RevisionRequested
ContentApproved
CampaignCompleted
ReviewSubmitted
```

These events can feed:

- Notifications
- Analytics
- Audit logs
- Intelligence systems
- Recommendation systems
- Reporting

---

70. FILE STORAGE

Campaign content must use object storage rather than database blobs.

Content should have:

- File ID
- Campaign ID
- Creator ID
- Version
- MIME type
- File size
- Storage location
- Upload timestamp
- Approval state

Signed/private URLs should be used where appropriate.

---

71. PERFORMANCE REQUIREMENTS

The product should feel fast even when dealing with large creator datasets.

Requirements:

- Paginated discovery
- Lazy loading
- Search indexing
- Cached intelligence summaries
- Asynchronous analytics processing
- Background social synchronization
- Background scoring
- Background fraud analysis
- Queue-based notification processing

Do not perform expensive intelligence calculations synchronously during ordinary page loads.

---

72. SCALABILITY

The architecture must support growth from:

1,000 creators

to:

100,000 creators

to:

1,000,000+ creators

without redesigning the core data model.

Social synchronization, scoring, analytics and fraud analysis should be asynchronous workloads.

---

73. MOBILE STRATEGY

The primary application should be responsive.

Priority:

1. Desktop
2. Tablet
3. Mobile

Creator campaign discovery and messaging must remain highly usable on mobile.

Brand intelligence and analytics may prioritize desktop/tablet because of information density.

---

74. TIA UI/UX DESIGN SYSTEM

Absolute design rules

Background

White-first.

Radius

0px.

No rounded cards.

No pill-shaped buttons.

No pill-shaped inputs.

No excessive rounded avatars.

Borders

Avoid borders as a decorative device.

Use borders/dividers only when they improve information separation.

Cards

Cards are not the default layout mechanism.

Use:

- Typography
- Whitespace
- Grid
- Tables
- Sections
- Dividers
- Background changes

instead.

Gradients

No gradients.

Shadows

Minimal.

Use only where elevation has a functional purpose.

Color

Minimal palette.

Primary brand blue based on the supplied TIA logo.

White is the dominant canvas.

Dark neutral is used for primary typography.

Muted neutrals are used for secondary information.

Additional colors should be reserved for semantic states such as:

- Success
- Warning
- Error
- Information

They must not become decorative accents.

---

75. TYPOGRAPHY

The interface should use a modern geometric sans-serif with a character similar to Open Sauce.

Typography must create hierarchy through:

- Size
- Weight
- Line height
- Letter spacing
- Position

Avoid decorative typography.

Headings should be strong and concise.

Body text should be highly readable.

Data should use tabular alignment where appropriate.

---

76. TIA VISUAL IDENTITY

The supplied TIA logo is the visual source of truth.

The product must preserve:

- Geometric construction
- Strong blue identity
- White space
- Sharp edges
- Minimal visual language
- Strong typographic presence

Do not introduce design elements that visually conflict with the logo.

The logo must not be placed inside unnecessary decorative containers.

---

77. DESIGN INSPIRATION

The product may take conceptual inspiration from:

- Atlassian
- Microsoft
- Razorpay

However, TIA must not clone their interfaces.

The inspiration should be limited to qualities such as:

- Information architecture
- Product clarity
- Enterprise usability
- Data density
- Navigation discipline
- Professionalism
- Consistency

TIA's visual identity must remain distinct.

---

78. PROHIBITED UI PATTERNS

The development team must NOT introduce:

- Purple AI gradients
- Blue/purple gradient backgrounds
- Glassmorphism
- Excessive rounded cards
- Excessive floating cards
- Giant decorative blobs
- Random 3D illustrations
- Excessive shadows
- Generic AI-generated dashboard layouts
- Excessive KPI cards
- Unnecessary charts
- Excessive animations
- Neon colors
- Decorative background patterns
- Fake testimonials inside product interfaces
- Generic startup illustrations
- Excessive empty space without purpose

---

79. TABLES AS A FIRST-CLASS COMPONENT

TIA is fundamentally a data platform.

Tables should therefore be treated as first-class UI components.

Tables should support:

- Sorting
- Filtering
- Pagination
- Column configuration
- Search
- Row actions
- Selection
- Bulk actions
- Responsive behavior
- Loading states
- Empty states

---

80. DASHBOARD PRINCIPLE

Every dashboard should answer:

1. What happened?
2. Why does it matter?
3. What should I do next?

Avoid dashboards that simply display metrics without action.

---

81. CREATOR HOME

Creator home should show:

```
Good morning, Creator.

Creator Intelligence
94 / 100

Recommended Campaigns
14

Active Campaigns
3

Pending Applications
7

Upcoming Deliverables
2

_____________________

Recommended for You

Campaign A        96%
Campaign B        92%
Campaign C        89%
```

---

82. BRAND HOME

Brand home:

```
Good morning, Brand.

Active Campaigns
4

Creator Proposals
28

Campaign Spend
₹8.4L

Average Campaign Match
91%

_____________________

Recommended Creators

Creator A     96%
Creator B     94%
Creator C     92%
```

---

83. CREATOR DISCOVERY SCREEN

Primary layout:

```
Creators

Search creators...

Platform | Category | Location | Audience | Price | Score

Creator | Audience | Intelligence | Match | Rate | Availability
```

This screen should prioritize rapid comparison.

---

84. CREATOR DETAIL SCREEN

Primary hierarchy:

```
Creator Identity
        ↓
Intelligence Score
```

```
        ↓
Platform Accounts
        ↓
Audience
        ↓
Authenticity
        ↓
Performance
        ↓
Reputation
        ↓
Commercial Terms
        ↓
Campaign History
        ↓
Invite / Contact
```

The brand should not need to navigate through multiple pages to determine whether a creator is suitable.

---

85. CAMPAIGN DETAIL SCREEN

Primary hierarchy:

```
Campaign
Brand
Objective
Budget

Requirements

Creator Matches

Applications

Bids

Messages

Contract

Content

Analytics
```

The campaign becomes the central object.

---

86. MESSAGING DESIGN

Messaging should visually connect communication with commercial context.

The conversation view should show:

- Campaign
- Participants
- Current offer
- Deliverables
- Deadline
- Contract status
- Payment status

This avoids fragmented workflows.

---

87. ANIMATION PRINCIPLES

Animation must communicate:

- Loading
- Transition
- Confirmation
- State change
- Progress

Animation must not exist merely to impress.

Recommended characteristics:

- Fast
- Precise
- Subtle
- Functional
- Consistent

---

88. EMPTY STATES

Empty states must be useful.

Example:

Instead of:

> "Nothing here!"

Use:

> **No campaigns yet.**
>
> Create your first campaign to begin discovering creators.

[Create Campaign]

---

89. ERROR STATES

Errors should explain:

1. What happened.
2. Why it happened where known.
3. What the user can do.

Example:

> **Instagram connection expired**
>
> TIA can no longer synchronize this account.

[Reconnect Instagram]

---

90. LOADING STATES

Use skeletons or progressive loading where appropriate.

Do not freeze the entire interface while intelligence calculations occur.

For expensive operations:

> **Analyzing creator audience...**

with progressive completion states where useful.

---

91. ACCESSIBILITY

TIA must target accessible interaction patterns.

Consider:

- Keyboard navigation
- Focus states

- Screen-reader semantics
- Color contrast
- Reduced motion
- Form accessibility
- Table accessibility
- Error announcements

The minimal visual design must not compromise accessibility.

---

92. OBSERVABILITY

Production infrastructure should monitor:

- API latency
- Error rates
- Social synchronization failures
- Payment failures
- Queue failures
- Database health
- Search latency
- AI service failures
- Fraud engine failures
- Notification failures

Critical events must be logged with sufficient context for diagnosis.

---

93. PRODUCT ANALYTICS

TIA itself should measure:

Creator funnel

Registration → Social connection → Verification → Profile completion → Application → Campaign → Completion

Brand funnel

Registration → Verification → Campaign creation → Creator discovery → Application → Selection → Payment → Completion

Marketplace

- Campaign supply
- Creator supply
- Applications per campaign
- Average campaign value
- Campaign completion

- Dispute rate
- Transaction volume
- TIA commission
- Creator retention
- Brand retention

---

94. NORTH STAR METRIC

The primary product metric should not simply be:

Number of registered creators.

A stronger North Star is:

Successful Campaigns Completed

A successful campaign should be defined using objective completion criteria.

Supporting metrics:

- GMV
- Net platform revenue
- Campaign completion rate
- Repeat brand rate
- Creator retention
- Average campaign value
- Match-to-contract rate
- Contract-to-completion rate
- Dispute rate

---

95. MVP DEFINITION

The initial release should NOT attempt to implement every future feature.

MVP must include

Authentication

- Creator registration
- Brand registration
- Login
- Password recovery
- Basic security

Creator

- Creator profile
- Social connection
- Social account verification
- Basic intelligence
- Rates
- Availability
- Campaign discovery
- Applications
- Bids
- Messaging

Brand

- Brand profile
- Verification
- Campaign creation
- Creator discovery
- Creator intelligence
- Match score
- Applications
- Bids
- Messaging

Campaign

- Campaign workflow
- Negotiation
- Agreement
- Payment
- Content submission
- Approval
- Completion

Platform

- 5% commission engine
- Transaction ledger
- Notifications
- Admin
- Basic fraud signals
- Basic analytics
- Audit logs

---

96. PHASE 2

Introduce:

- Advanced creator intelligence

- Advanced fraud detection
- Creator reputation
- Brand reputation
- Advanced campaign analytics
- Attribution
- Creator comparison
- Pricing intelligence
- AI campaign matching
- AI campaign recommendations
- Advanced reporting
- Advanced moderation
- Dispute system

---

97. PHASE 3

Introduce:

- Predictive campaign performance
- Portfolio optimization
- Advanced ROI prediction
- Creator demand forecasting
- Advanced pricing intelligence
- Creator benchmarking
- Advanced attribution
- Enterprise analytics
- API
- Webhooks
- Enterprise team management

---

98. PHASE 4

Introduce:

- Global enterprise infrastructure
- White-label marketplace
- Intelligence API
- Agency ecosystem
- Advanced recommendation infrastructure
- Cross-platform audience intelligence
- Advanced predictive intelligence
- Enterprise integrations

---

99. FUTURE PLATFORM EXPANSION

The architecture should allow future support for additional social platforms without redesigning:

- Creator identity
- Campaigns
- Social account model
- Intelligence engine
- Matching engine
- Analytics
- Search

New platforms should implement the common social integration interface.

---

100. CORE DATA FLYWHEEL

TIA's long-term strategic advantage should come from:

```
More Creators
      ↓
More Campaigns
      ↓
More Transactions
      ↓
More Performance Data
      ↓
Better Intelligence
      ↓
Better Matching
      ↓
Better Campaign Outcomes
      ↓
More Brands
      ↓
More Campaigns
```

This feedback loop should be reflected in the architecture from the beginning.

---

101. PRODUCT MOAT

TIA should develop four interconnected moats.

1. Creator Intelligence

Understanding creator audiences and performance.

2. Trust Graph

Understanding creator authenticity, reputation and campaign reliability.

3. Campaign Performance Graph

Understanding which creators perform for which campaign types.

4. Marketplace Network

More brands attract more creators, and more creators attract more brands.

Together these produce a substantially stronger competitive position than a basic influencer marketplace.

---

102. NON-FUNCTIONAL REQUIREMENTS

The platform must be:

- Secure
- Responsive
- Accessible
- Observable
- Internationalized
- Modular
- API-first
- Scalable
- Auditable
- Fault tolerant
- Privacy-conscious
- Platform-agnostic
- Maintainable

---

103. DEVELOPMENT PRINCIPLES

The development team must not optimize for rapid visual completion at the expense of architecture.

Do not:

- Hard-code platform-specific assumptions into core entities.
- Store raw social credentials insecurely.

- Couple recommendation logic directly to UI components.
- Calculate expensive analytics on every request.
- Build fraud detection entirely into frontend logic.
- Hard-code commission percentages.
- Mix financial ledger logic with campaign UI logic.
- Treat AI-generated responses as authoritative data.
- Build five independent creator systems for five platforms.

---

104. FRONTEND ARCHITECTURE

The frontend should use a component-driven architecture with a centralized TIA design system.

Core component categories:

```
Navigation
Buttons
Inputs
Tables
Filters
Search
Tabs
Dialogs
Drawers
Forms
Status Indicators
Score Displays
Charts
Timeline
Messaging
File Upload
Content Review
Campaign Components
Creator Components
Analytics Components
```

Every component must conform to the TIA design system.

---

105. DESIGN SYSTEM ENFORCEMENT

The codebase should use centralized design tokens.

Example conceptual tokens:

```
color.primary
color.background
```

```
color.text
color.muted
color.success
color.warning
color.error

radius.none

spacing.xs
spacing.sm
spacing.md
spacing.lg
spacing.xl

font.heading
font.body
font.data
```

The design system should make it technically difficult for developers or AI coding agents to introduce unauthorized gradients, rounded components or inconsistent colors.

---

106. AI CODING AGENT RULE

Any AI development agent working on TIA must follow this hierarchy:

1. Product requirements

Highest priority.

2. TIA design system

Second priority.

3. Existing component system

Third priority.

4. Feature-specific requirements

Fourth priority.

The agent must not independently invent a visual style.

If a component already exists in the TIA design system, reuse it rather than generating a visually different component.

---

107. UI QUALITY STANDARD

A screen is not considered complete merely because:

- It renders.
- It is responsive.
- The API works.

It must also satisfy:

- Visual hierarchy
- Information hierarchy
- Alignment
- Typography
- Accessibility
- Interaction consistency
- Empty state
- Loading state
- Error state
- Mobile behavior
- Keyboard behavior where applicable
- Design-system compliance

---

108. DEFINITION OF DONE

A feature is complete only when:

- Backend functionality works.
- API validation exists.
- Authorization exists.
- Error handling exists.
- Loading states exist.
- Empty states exist.
- Analytics events exist where relevant.
- Audit events exist where relevant.
- Responsive UI works.
- Accessibility has been considered.
- Security requirements are implemented.
- Design-system rules are followed.
- Tests exist for critical business logic.
- Documentation exists where required.

---

109. CRITICAL BUSINESS LOGIC TESTS

Automated tests must cover at minimum:

- Commission calculation
- Campaign state transitions
- Authorization
- Bid acceptance
- Negotiation
- Contract status
- Payment state
- Creator eligibility
- Campaign matching
- Score calculation
- Fraud-risk classification
- Reputation calculation
- Payout calculation
- Dispute state transitions

---

110. SECURITY-CRITICAL TESTS

Test:

- Unauthorized campaign access
- Unauthorized creator data access
- Unauthorized financial data access
- Token exposure
- Cross-organization data access
- Role escalation
- File upload vulnerabilities
- API abuse
- Rate limiting
- Session invalidation

---

111. MVP SUCCESS CRITERIA

The MVP should prove five hypotheses:

Hypothesis 1

Creators are willing to connect their social accounts to TIA.

Hypothesis 2

Brands value intelligence beyond follower count.

Hypothesis 3

Brands are willing to transact through TIA.

Hypothesis 4

Creators are willing to apply and negotiate inside TIA.

Hypothesis 5

The intelligence layer increases campaign matching quality.

---

112. FINAL PRODUCT POSITIONING

TIA should ultimately be understood as:

> **A global creator intelligence and campaign marketplace that allows brands to discover the right creators, understand their audiences, verify their authenticity, execute campaigns, and measure outcomes — entirely within one platform.**

The marketplace is the **transaction layer**.

The intelligence engine is the **decision layer**.

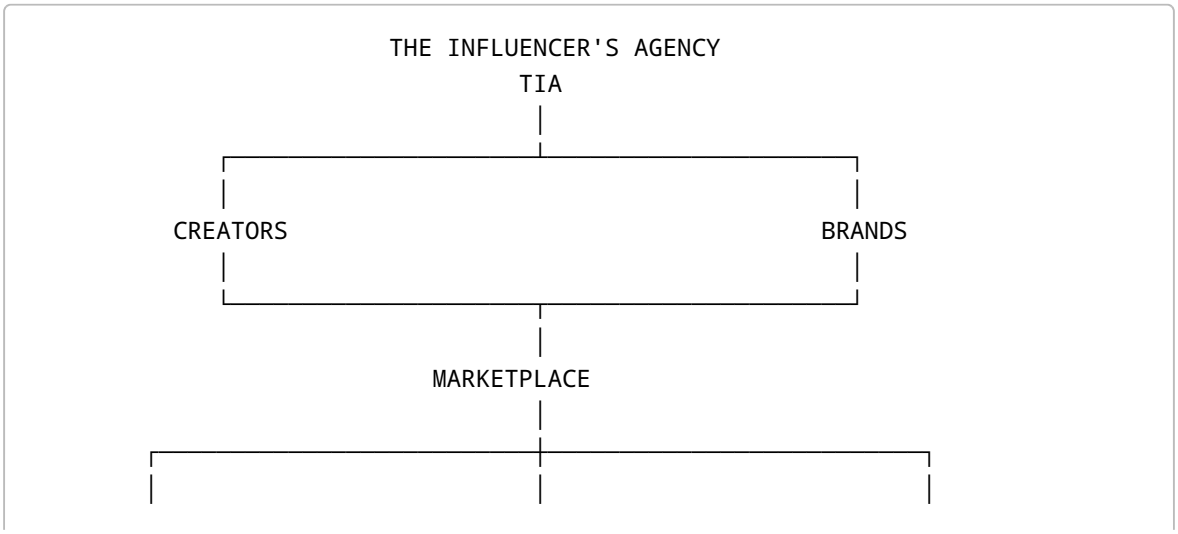

The campaign workspace is the **execution layer**.

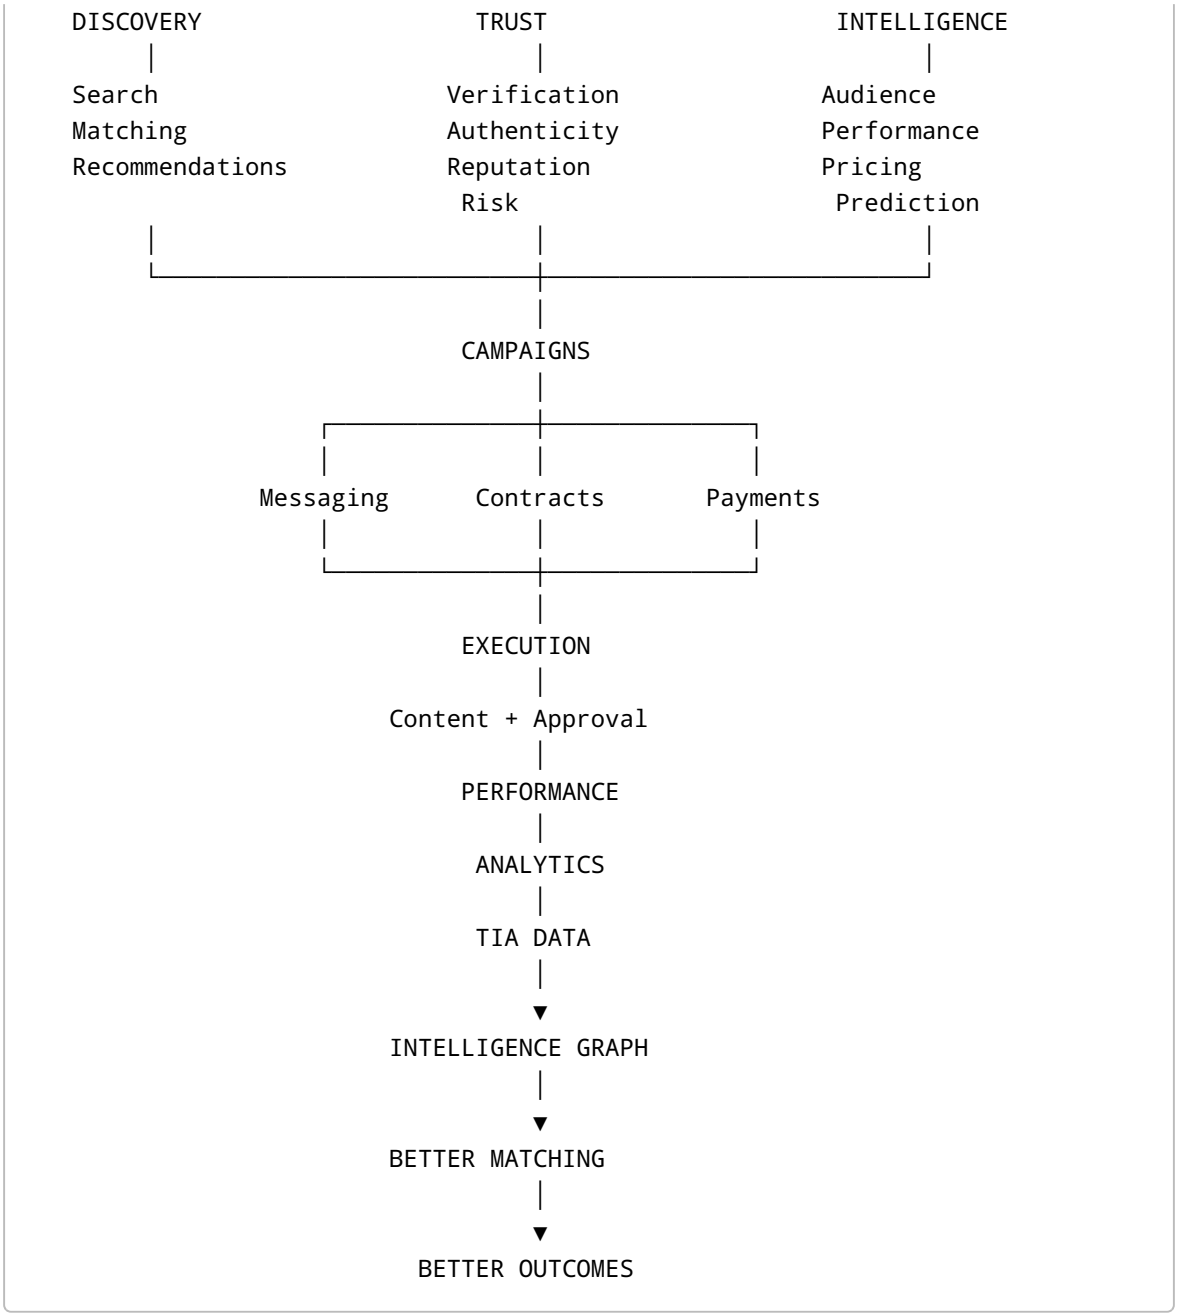

The analytics system is the **measurement layer**.

The accumulated campaign data is the **long-term competitive moat**.

---

113. FINAL PRODUCT ARCHITECTURE

114. TIA DESIGN NORTH STAR

The final interface should communicate:

Precision.

Trust.

Intelligence.

Control.

Professionalism.

It should look like software that serious brands and professional creators use to conduct commercial transactions—not like a generic AI-generated startup dashboard.

The design language is therefore:

White canvas + TIA blue + strong typography + geometric construction + sharp edges + deliberate whitespace + dense useful information + minimal decoration.

The interface should feel **engineered, not decorated.**

115. PRODUCT NORTH STAR

The ultimate question TIA should answer for a brand is:

> **"Who should I work with?"**

And the answer should be based on:

who the creator reaches + whether that audience is authentic + whether that audience fits the campaign + how the creator has performed historically + what the creator costs + how trustworthy the creator is + what TIA predicts may happen.

For the creator, the corresponding question is:

> **"Which brands should I work with, what should I charge, and which campaigns are actually worth my time?"**

TIA should answer both questions through one unified intelligence-driven marketplace.
